**Role of the liver in the deamination of amino acids.** A. M. Maklinia, *J. Physiol. U. S. S. R.* 29, 327-33 (in English, 333) (1940). Alanine was injected into dogs and rabbits (portal vein); 10-15 min. later a small increase in NH<sub>3</sub> concn. was observed in the liver. It may be due not to increased formation, but to absorption, of NH<sub>3</sub> from the blood by the liver. Under the influence of alanine the hepatic ureogenesis was increased in most cases. In fasting animals the liver eliminated a slight amt. of urea into the portal blood. On alanine injection this elimination was increased. The intestines have a deaminating ability both in fasting animals and in those receiving alanine injections. The intestines were able both to retain and to eliminate urea, but exact conditions are not yet known.

TITLE: Summing up powers of several independent oscillators operating at the same frequency

SOURCE: Radiotekhnika i elektronika, v. 12, no. 1, 1967, 115-117

TOPIC TAGS: electronic oscillator, rf oscillator

ABSTRACT: The maximum power is determined which can be obtained by means of combining together the powers of several oscillators whose phase difference varies in time randomly; the mean value of this phase difference, for any two oscillators, is zero over a sufficiently long time interval. It is proven that the power combined in one output cannot exceed the maximum power of the most powerful oscillator if the summation is performed by a passive multipole. The explanation is that the power of each oscillator is partially dissipated in the internal resistances of other oscillators (and also in the multipole if the latter is resistive). "In conclusion, the author wishes to thank M. B. Golant, A. A. Vizel', and V. V. Livshits for their comments." Orig. art. has: 2 figures and 8 formulas.

TITLE: More Attention to Inhabitants of Domestic Fresh Water Bodies  
(Bol'she vnimaniya obitatelyam otechestvennykh presnykh vod)

PERIODICAL: Priroda, 1958, Nr 9, pp 115-116 (USSR)

ABSTRACT: The author thinks that aquarium owners, schools especially. should not take pride in exotic aquarium plants and fish alone, but should also consider domestic species. However, the domestic species should include not only the general fauna and flora of Central Europe, but also that of the Soviet East, Transcaucasus and Central Asia. Among such plants, the author recommends Villarsia nymphoides from many regions of Soviet South and East, Ottelia alismoides from the Ussuri area and Najas graminea from the Volga river delta. Among fish, he quotes Percottus glehni, Liocassis braschnikowi, Sarcochilichthys sinensis lacustris and Leptobotia mantschurica from the Amur river, Ophiocephalus argus, and Umbra krameri from the Dnepr river.

time of the fish. In some instances his polyacanthus fixed their nests of spittle and air bubbles to plant stalks near the water surface as well as to items on the bottom of the aquarium. This latter instance, confirmed by repeated observation over some period of time, but contrary to the general procedure of the Anabantidae, was repeated also under experimental circumstances and seems to cast new light on the meaning of the bubble nest, which has not yet been described in the pertinent literature. The author thinks that this phenomenon is worth further observation and tentatively concludes that polyacanthus is the one among the Anabantidae that also builds its nest on and near the bottom of the waters of its natural habitat. Building of the bubble nest near the water surface is done to cover a shorter distance between the nest and the water surface, least absence from the nest for inhalation purposes be too extended in case of danger threatening the young. The air in the nest bubble is not

TITLE:

The Propagation of Polyacanthus (Razmnozheniye poli-  
akanta)

PERIODICAL:

Priroda, 1955, Nr 2, pp 116-117 (USSR)

ABSTRACT:

The author describes some general and special features of the small Macropodus cupanus Dayi. This fish, also referred to as Polyacanthus, of the Anabantidae family originate in boggy and almost stagnant waters of East India, Malacca and Burma. It has an additional respiratory organ above the gill arcs, which allows for direct inhalation of the air above the water surface, when the fish rises to the top of the water. Thus the fish may persist, where other fish would perish due to the lack of oxygen in the water. Kept in an aquarium, the polyacanthus is an interesting object for observation and study. The author, upon a brief outline of the principal requirements for keeping polyacanthus in an aquarium, relates certain observations he made during the spawning

TITLE: Construction of Canals in Sliding Areas

PERIODICAL: Gidrotekhnicheskoye stroitel'stvo, 1959, Nr 9, pp 8-9  
(USSR)

ABSTRACT: In 1957 between the 9th and 16th km of the Severnyy Donets-Donbass Canal a landslide happened over a total length of 1,800 m. The canal was constructed there on clays and stratified consolidated sands, partly kaolinized. The author describes the measures undertaken to increase stability of the ground and to enable a normal canal operation (partly replacing of sliding material by loam, changing of the side slope by construction of less inclined sides, and other usual consolidation works). There is 1 photograph, 1 table and 1 diagram.

*CF* 8  
A contribution to the problem as to the chemical composition of the potash-soda feldspars in the alkaline rocks of the Khibiny Tundras. V. G. Makhlay (Hertzen Pedagogical Inst., Leningrad). *Compt. rend. acad. sci. U.R.S.S.* 53, 155 (1940). The quant. mineralogical

compn. of foyite, mica nepheline syenite, argirine-hornblendic nepheline syenite, trachytoid khibinitite, feldspathic johite, nepheline porphyry, and vein nepheline syenite in khibinitite was studied by examn. of polished surfaces and by chem. analysis of the rock and its feldspar in order to trace the relation of the K-Na feldspars to the compn. of the rock. The compn. of the nepheline-feldspar eutectic was taken at 33 of the former to 67 of the latter. The higher the K (or Na) content of the rock, the higher it is in the feldspar of the rock; the ratio of  $K_2O/Na_2O$  in the feldspar as compared to that in the rock is dependent on the order of crystn. of the minerals concerned.
